

TRAINING MANIKINS FOR POLICING AND PRISON SERVICES

RUTH LEE 
FOR PROFESSIONALS WHO SAVE LIVES

POLICING AND PRISON SERVICE MANIKINS FOR PROFESSIONALS WHO SAVE LIVES

Ruth Lee manikins are used by Police Forces across the world. We also provide manikins to a large number of prisons and other correctional facilities.

DUTY RANGE

These are the most popular Police / Law Enforcement manikins on the market for PSU training, public order, major incident and CBRN exercises.

They are tough and durable, can be dragged behind a car or dropped from a second storey building with no damage!

PRISONER SECURITY

Used by CERT (Correctional Emergency Response Teams) worldwide for practising cell extractions and restraint techniques.

With a reinforced neck, this manikin can also be used to simulate a suicide through hanging to practise body recovery and evidence preservation techniques.

BODY RECOVERY

A pre-established protocol is essential for victim retrieval - the Body Recovery manikin was predominately designed to aid Police dive teams train to recover bodies from any inland waters or under ice.

This manikin will sink when placed in the water and is visible to sonar devices.

MASS CASUALTY

During an emergency such as a terrorist attack, fire or natural disaster, in a high population area, the number of casualties will likely be high.

These manikins are perfect for large scale emergency drills. They are a lightweight and a cost-effective option to create real impact when a large number of casualties are required.

FULL BODIED CPR AND AIRWAY MANAGEMENT

CPR and Airway Management training is often carried out in a warm, well lit, carpeted classroom with plenty of space. How well do you think your staff would cope, performing these skills in a confined space or if the 'casualty' was trapped by the legs? Training in realistic scenarios will mean that your teams react more effectively in a real emergency.

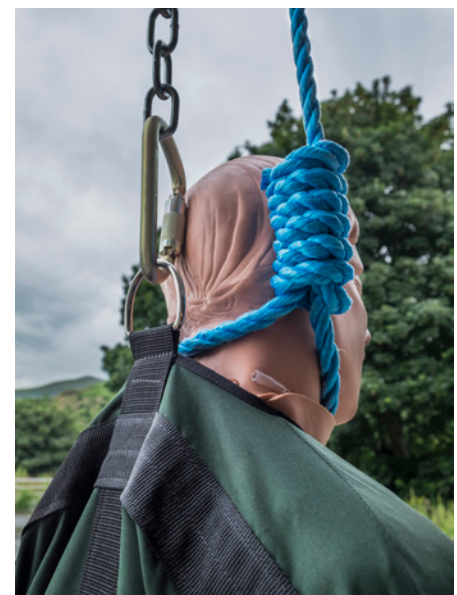

LIGATURE

The frequency of suicide is tragically high in environments such as prisons, police stations and mental health hospitals. Staff who work here should have training to cope in such a situation.

Training includes the use of a hook knife to properly release a ligature and this specialist manikin has been designed to allow teams to learn to effectively and sensitively manage this situation.

This manikin has anatomical features which allow you to practise airway management skills, with the hope of reviving someone who has been found hanging.

SEARCH AND RESCUE

The Search & Rescue model is deliberately designed to be difficult to see in the water to enable crews to develop the 'search' element of their Search & Rescue training, making this model particularly suitable for Police Forces or inland water rescue teams.

BARIATRIC

Obesity is a global problem and you might be expected to assist a 'plus-size' person.

Our Bariatric range currently includes manikins weighing in at 90, 180 and 260kg. Our 90kg manikin is perfect where you require the bulk of a bariatric, without excessive weight.
